

Economics

Market failure under forgeable evidence

Generation is near-free.
Verification is expensive.

Buyers cannot observe
quality before purchase

Cheap signals substitute:
identity, adoption counts

Two mechanisms
FINE pF and PREMIUM ?

Unresolved: when the
evidence itself can be forged

Akerlof (1970)
Spence (1973)
Nash (1950)
M?kimattila et al. (2025)

motivates

Computer science

Machine-checkable trace file and verifier

PER-CLAIM TRACE FILE

claim id
source link
dataset version
input / output value

content-addressed sources
(hash, not URL)

ONE-CLICK VERIFIER
recompute the declared value,
compare: pass / fail

Build layer exists (SLSA).
The claim layer is the contribution.

Buneman et al. (2001)
SLSA specification v1.2
CKAN 2.11

enables

Behavioral science

Honesty, justification and over-trust

Justification account:
dishonesty grows with excuses

Moral licensing (competing):
easy checking may reduce scrutiny

**They separate on
verifier attention**

Risk: over-trust migrating from
AI outputs to AI-generated evidence

Next test: cross trace-file presence
with verifier scrutiny depth

Shalvi et al. (2012)
